

Report and Technical Analysis

CAPSTONE OVERVIEW

A national, state and city-specific look at modern trends of Asian immigration is my final capstone for the General Assembly data analytics immersion. This project takes a macro and more specific view of U.S., California and Sacramento Asian American demographics and characteristics. Below I document *goals, data sources, patterns, trends & insights, and recommendations.*

UPDATED GOALS

To apply the data analytics workflow and focus on immigration trends of Asian origin groups nationally, in California state, and Sacramento using data from 2010 onwards.

To use Python for data exploration and analysis of the 2024-2025 Filipinx community survey conducted by Sacramento-based Amado Khaya Foundation.

To utilize data cleaning, preparing data sets in Excel and data visualization skills in Tableau for presentations to stakeholders.

To work with demographic data and gain domain expertise for future employment.

- Explore the benefits and challenges of using data from government sources
- Explore other sources of demographic data

DATA SOURCES

Thankfully this topic led to many credible and relevant data sources. I cleaned, edited, manipulated and utilized a dozen data sets and various reports, articles and fact sheets to complete this presentation. Here is a complete list of the following sources:

- [U.S. Census Bureau](#)
 - Quick Facts: California and Sacramento County
 - Median Household Income (2010-2023)
 - U.S. Asian population data (data set)
- [Pew Research Center](#)
 - Asian Americans: Research and Data
 - A Survey Data Snapshot
 - Facts about Asians in the U.S.
- [AAPIData at Asian American Resource Center at UC Berkeley](#)
 - Community Counts Dashboard
 - 2025 Fact Sheet- AANHPIs in California
- [California Open Data Portal](#)
- [City of Sacramento Open Data](#)
- [IMPUMS USA: U.S. Census Data for Social, Economic, and Health Research](#)
- [Public Policy Institute of California](#)
 - Article: Most new immigrants are from Asia
- [San Francisco Chronicle](#)
 - Article: Map shows how California's Asian Americans live and how that's changed over time
- [DataPandas.org](#)
 - Asian Population by State (data set)
- [2024 Filipinx Survey Data \(AK Foundation\)](#)

PATTERNS, TRENDS & INSIGHTS

- Continued growth of the Asian American population
 - The data shows that there will be a continued *increase* in the population of Asian Americans in many Asian origin groups.
 - There will be continue to be significant growth particularly from *South Asia* and *mixed race Asians*.

PATTTTERNS, TRENDS & INSIGHTS CONTINUED

- Based on data forecasting, the Sacramento household median income may slightly surpass the California state household median income by the end of 2030.
 - However, the data quality could be more consistent for prediction purposes (see *recommendations*)
- There is an extremely wide range of median household income across Asian origin groups.
 - In 2023, while the median household income of Asian groups was \$105,600, the range was from the lowest \$54,300 (Mongolians) to highest group at \$151,200 (Indians).
- The AK Foundation's 2024-2025 Filipinx Sacramento-based survey needs a wider sample pool. Drawing from the *Python EDA Survey_Capstone*, I see that the results are heavily skewed towards upper class, second-generation, Filipino educators or students. The survey findings do not show much variety among other professions and income brackets.
 - More than half of the survey participants are in education (20/38)
 - Nearly 25 respondents (of those who chose to respond) identified a household income over \$100,000 which is compared to \$88,724 which is the 2023 median household income for Sacramento county.

RECOMMENDATIONS

- Continue to forecast population growth by exploring predictive models of specific Asian groups.
 - The *U.S. Census Bureau/American Community Survey* and *Pew Research Center* are reliable data sources for demographic data. Highly recommend these sources for future data students!

RECOMMENDATIONS CONTINUED

- Strive for a wider sample pool of the 2024-2025 Filipinx Sacramento-based survey.
 - Even though 40 participants is a good start, I don't think the survey results include a wide enough sampling to present to policy makers.
 - I strongly recommend to the *main stakeholder* (Amado Khaya Foundation) to focus on increasing the sample pool before any further EDA.
- Better quality and consistent data across sources for median household income EDA.
 - Governmental and several educational institutional data had discrepancies across data sets.
 - Because of the extremely wide range of median household income among Asian origin groups, I think aggregating the data as "All Asian Groups" is not an accurate picture of this grouping.
 - I recommend for data professionals also viewing the disaggregate data grouping for a more realistic measure of the numbers.
