

EXPLORATORY DATA ANALYSIS (EDA) OF 2025 FILIPINX SURVEY

PRESENTED BY V.B. | JULY 2025

Process

Python + Jupyter Notebook

For my final capstone project, in addition to presenting a national, California state and Sacramento county look at demographic trends (mainly ***spatial analysis***), I dove into the AK 2025 Filipinx Survey using industry standard coding program ***Python***, Jupyter Notebooks and Python libraries such as Pandas, MadPlotLib and Plotly for visualizations.

E.D.A.

Exploratory Data Analysis

E

Exploration aims to condense large datasets into a more understandable form using summary statistics, tables, and visualizations

D

Specific to local survey: survey data was gathered from primary source. Data was extracted, cleaned and prepared for analysis.

A

Used *Univariate Analysis* (primarily) by category.

Univariate data refers to a type of data in which each observation or data point corresponds to a single variable. In other words, it involves the measurement or observation of a single characteristic or attribute for each individual or item in the dataset. Analyzing univariate data is the simplest form of analysis in statistics.

Categories Explored:

- General Demographics
- Citizenship
- Education
- Employment
- Remittances
- Housing
- Political Party
- Other (nulls, removing columns, additional EDA)

**For a closer look,
let's go into the
Jupyter
Notebook!**
